Agents for Amazon Bedrock

In this section,

You will perform the following steps:

1. Configure an agent for your use case and add actions the agent can perform. To define how the agent handles the actions, we have configured Lambda functions in this workshop.
2. Associate a knowledge base with the agent to augment the agent's performance.
3. Test your agent in the Amazon Bedrock console. Modify the configurations as necessary. Use traces to examine your agent's reasoning process at each step of its orchestration.
