Guardrails for Amazon Bedrock

In this section,

You will perform the following steps:

1. Define Guardrails by setting up the configurations, defining topics to deny, providing filters to handle harmful and sensitive content, and writing messages for when prompts and user responses are blocked.
2. Test the Guardrails against a foundational model to understand how they work and their impact on model outputs.
3. Integrate the Guardrails with the agent created earlier, applying them to the agent's flow to observe how they influence the agent's responses and actions.
